Last revised 7/1/99

Appendix A: Additional drawings

THESE RIVETS MUST BE ADDED TO FRONT WING SPAR.

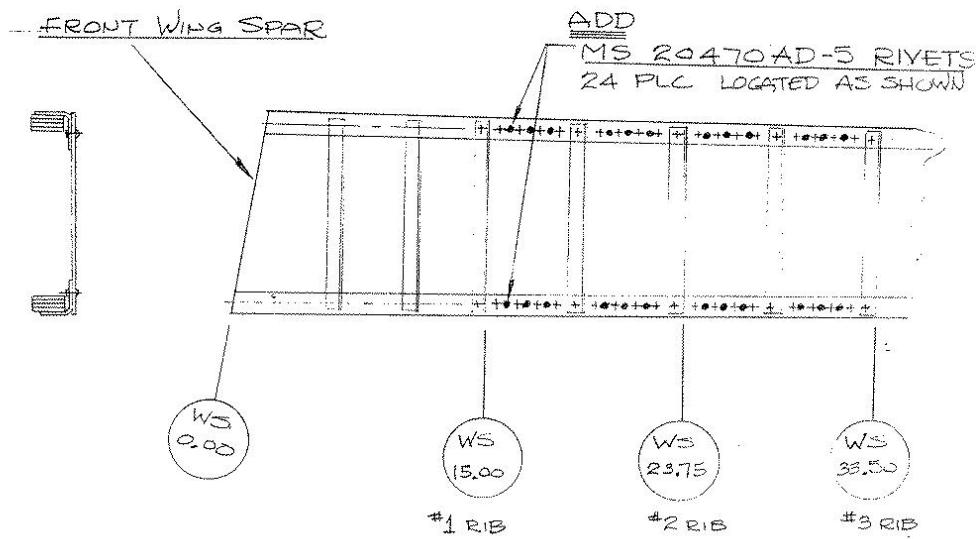

Figure A.1 This spar mod may be accomplished with AN3 bolts, if necessary.

TAIL WHEEL STRUT ASSEMBLY

PREPARATION:

1. De-burr all parts and round sharp edges.
2. Drill and tap two #10-32 holes at bottom of strut -1, 180 degrees apart and .80" up from bottom of strut (See sketch).
3. Drill two .125" diameter holes in -3 (See sketch).
4. Steering clamp -3 must be free to rotate when assembled in place. To insure this, spray paint or layout dye, on inside of -3. Loosely assemble -3 in place on -1. Rotate to locate any high spots. Remove high spots until -3 rotates smoothly when BOLTED in place on -1.
5. Make -38 pin by cutting bar and thread from close tolerance 6/16 bolt. -33 should be 1.70" long. Check for close but free fit in -2 piston.
6. Install -23 bushing in -1, be sure it is bottomed.
7. Next install -18 being sure it is bottomed AND free to rotate.
8. Install two # 10 screws in -1 to engage -18 WITHOUT locking it.
9. Lock wire or lock washer the # 10 screws.

ASSEMBLY:

1. Use a good general purpose grease when assembling.
2. Stack -25 springs, -30 spacer, -49 teflon washer, -16 bushing, -23 bushing and -20 guide on -2 piston. To do this, you will need to make a ring which is about .3" long, seats on -20 and allows -2 piston to pass through, as you compress -25 spring.
- CAUTION !!
3. You will need a fixture that exerts about 100 pounds of force, to compress the spring. BE VERY CAREFUL TO CONTAIN THIS ASSEMBLY, prior to installing -33 pin. If the assembly were to slip or dislode in any way, SERIOUS INJURY could result.
4. CAREFULLY, align the slot in -2 piston with the hole in -20 guide and install -33 pin.
5. CAREFULLY, remove fixture pressure from the assembly, allowing -33 pin to assume the spring pressure.
6. This assembly can now be greased and lowered into -1 strut. Some pressure will be required to install -3 clamp.
7. Align the slot in -3 clamp with the slot in -20 guide. Place -27 lock in its slot and install AN4 bolts.
8. Place two .125 diameter clevis pins in the holes in -3 clamp and install -26 springs.
9. Press -42 tail wheel fork, into -2 piston, BE SURE TO ALIGN axle 90 degrees to steering lock slot in -3, then drill .250 diameter and install AN4 bolt.
10. When installing wheel on axle, a spacer tube will be required to prevent the tire from contacting -42 fork.
11. The axle will require some reduction in diameter, to slide the wheel in place. Secure wheel with washer, nut and cotter pin.

INSTRUCTIONS : CRANKCASE - GEAR BOX CONCENTRICITY ALIGNMENT

The location of the two .620 diameter crankcase dowels where the transmission bell housing usually mounts is not always known precise enough for proper mating of a reduction gear assembly. By using the piloted reamer and the bushings provided in the alignment kit and following this procedure, the dowel holes in the rear case can be match reamed to obtain the proper alignment.

- (1) Remove the crankcase dowels and replace with the two hardened bushings. Press the bushings in flush with the surface. These bushing are sized to accept the .4375 diameter pilot on the lip of the reamer.
- (2) Detach the bell housing(rear case) from the gear box and bolt it to the crankcase. Snug the bolts but DO NOT over-tighten.
- (3) Mount a dial indicator on the flywheel or the end of the crankshaft. Indicate on the 12.00" O.D. of the snap diameter that locates the reduction gear assembly. Bump the bell housing as necessary to achieve concentricity, a total indicator reading of no more than .0005, and then tighten the bolts. **NOTE:** When indicating for concentricity, the crankshaft should be positioned vertically to minimize any gravitational influence.
- (4) With a 1/2" electric drill, use the piloted reamer to ream out the undersize holes in the bell housing to a diameter of .620.
- (5) Remove bushings and reinstall dowels.

It must be understood that this procedure modifies the bell housing to match only that particular crankcase. Mounting the gear box on a different engine block would require sleeving the holes and repeating the above procedure.
